Today's Menu

	Time	Topics
I	9:00-10:15 AM	Setup and Motivation
	10:15-10:30 AM	Coffee Break
II	10:30-12:00 AM	Beginning Unix
	12:00-1:00 PM	Lunch
III	1:00-2:15 PM	Working with Unix
	2:15-2:30 PM	Coffee Break
IV	2:30-4:00 PM	How to Get Working

<http://bioboot.github.io/web-2016/setup/>

Lets get started....

Do it Yourself!

Mac
Terminal

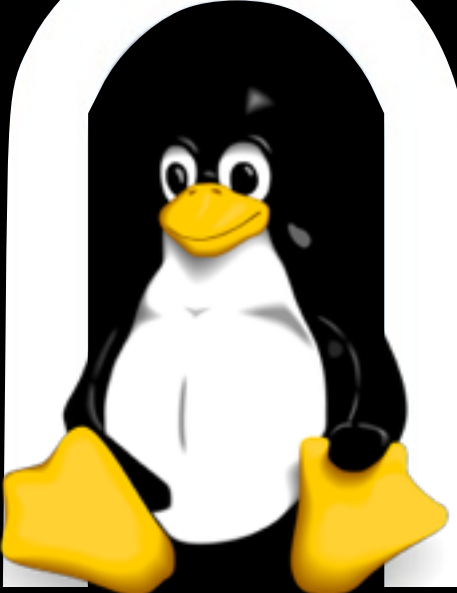

PC
MobaXterm

Setup Checklist

<http://bioboot.github.io/web-2016/setup/>

- ☑ **Mac**: Terminal *or* **PC**: MoblXterm
- ☑ **Mac**: Git install *or* **PC**: MoblXterm plugins for git & CygUtils
- ☑ Python Anaconda install
- ☑ R and RStudio install
- ☑ Flux access form submitted
- ☑ Duo mobile app obtained
- ☑ Example data downloaded: <http://tinyurl.com/day1-unix>

Introduction To UNIX

A cartoon penguin, Tux, is positioned in the center of the slide, standing within the letter 'N' of the word 'UNIX'. Tux is a black and white penguin with a yellow beak and feet, looking directly at the viewer.

Motivation

Why do we use Unix?

Modularity	Core programs are modular and work well with others
Programmability	Best software development environment
Infrastructure	Access to existing tools and cutting-edge methods
Reliability	Unparalleled uptime and stability
Unix Philosophy	Encourages open standards

Modularity	Core programs are modular and work well with others
Programmability	Best software development environment
Infrastructure	Access to existing tools and cutting-edge methods
Reliability	Unparalleled uptime and stability
Unix Philosophy	Encourages open standards

Modularity

The Unix shell was designed to allow users to easily build complex workflows by interfacing smaller **modular programs** together.

An alternative approach is to write a **single complex program** that takes raw data as input, and after hours of data processing, outputs publication figures and a final table of results.

Which would you prefer and why?

Modular

vs

Custom

Advantages/Disadvantages

The 'monster approach' is customized to a particular project but results in massive, fragile and difficult to modify (therefore inflexible, untransferable, and error prone) code.

With **modular workflows**, it's easier to:

- Spot errors and figure out where they're occurring by inspecting intermediate results.
- Experiment with alternative methods by swapping out components.
- Tackle novel problems by remixing existing modular tools.

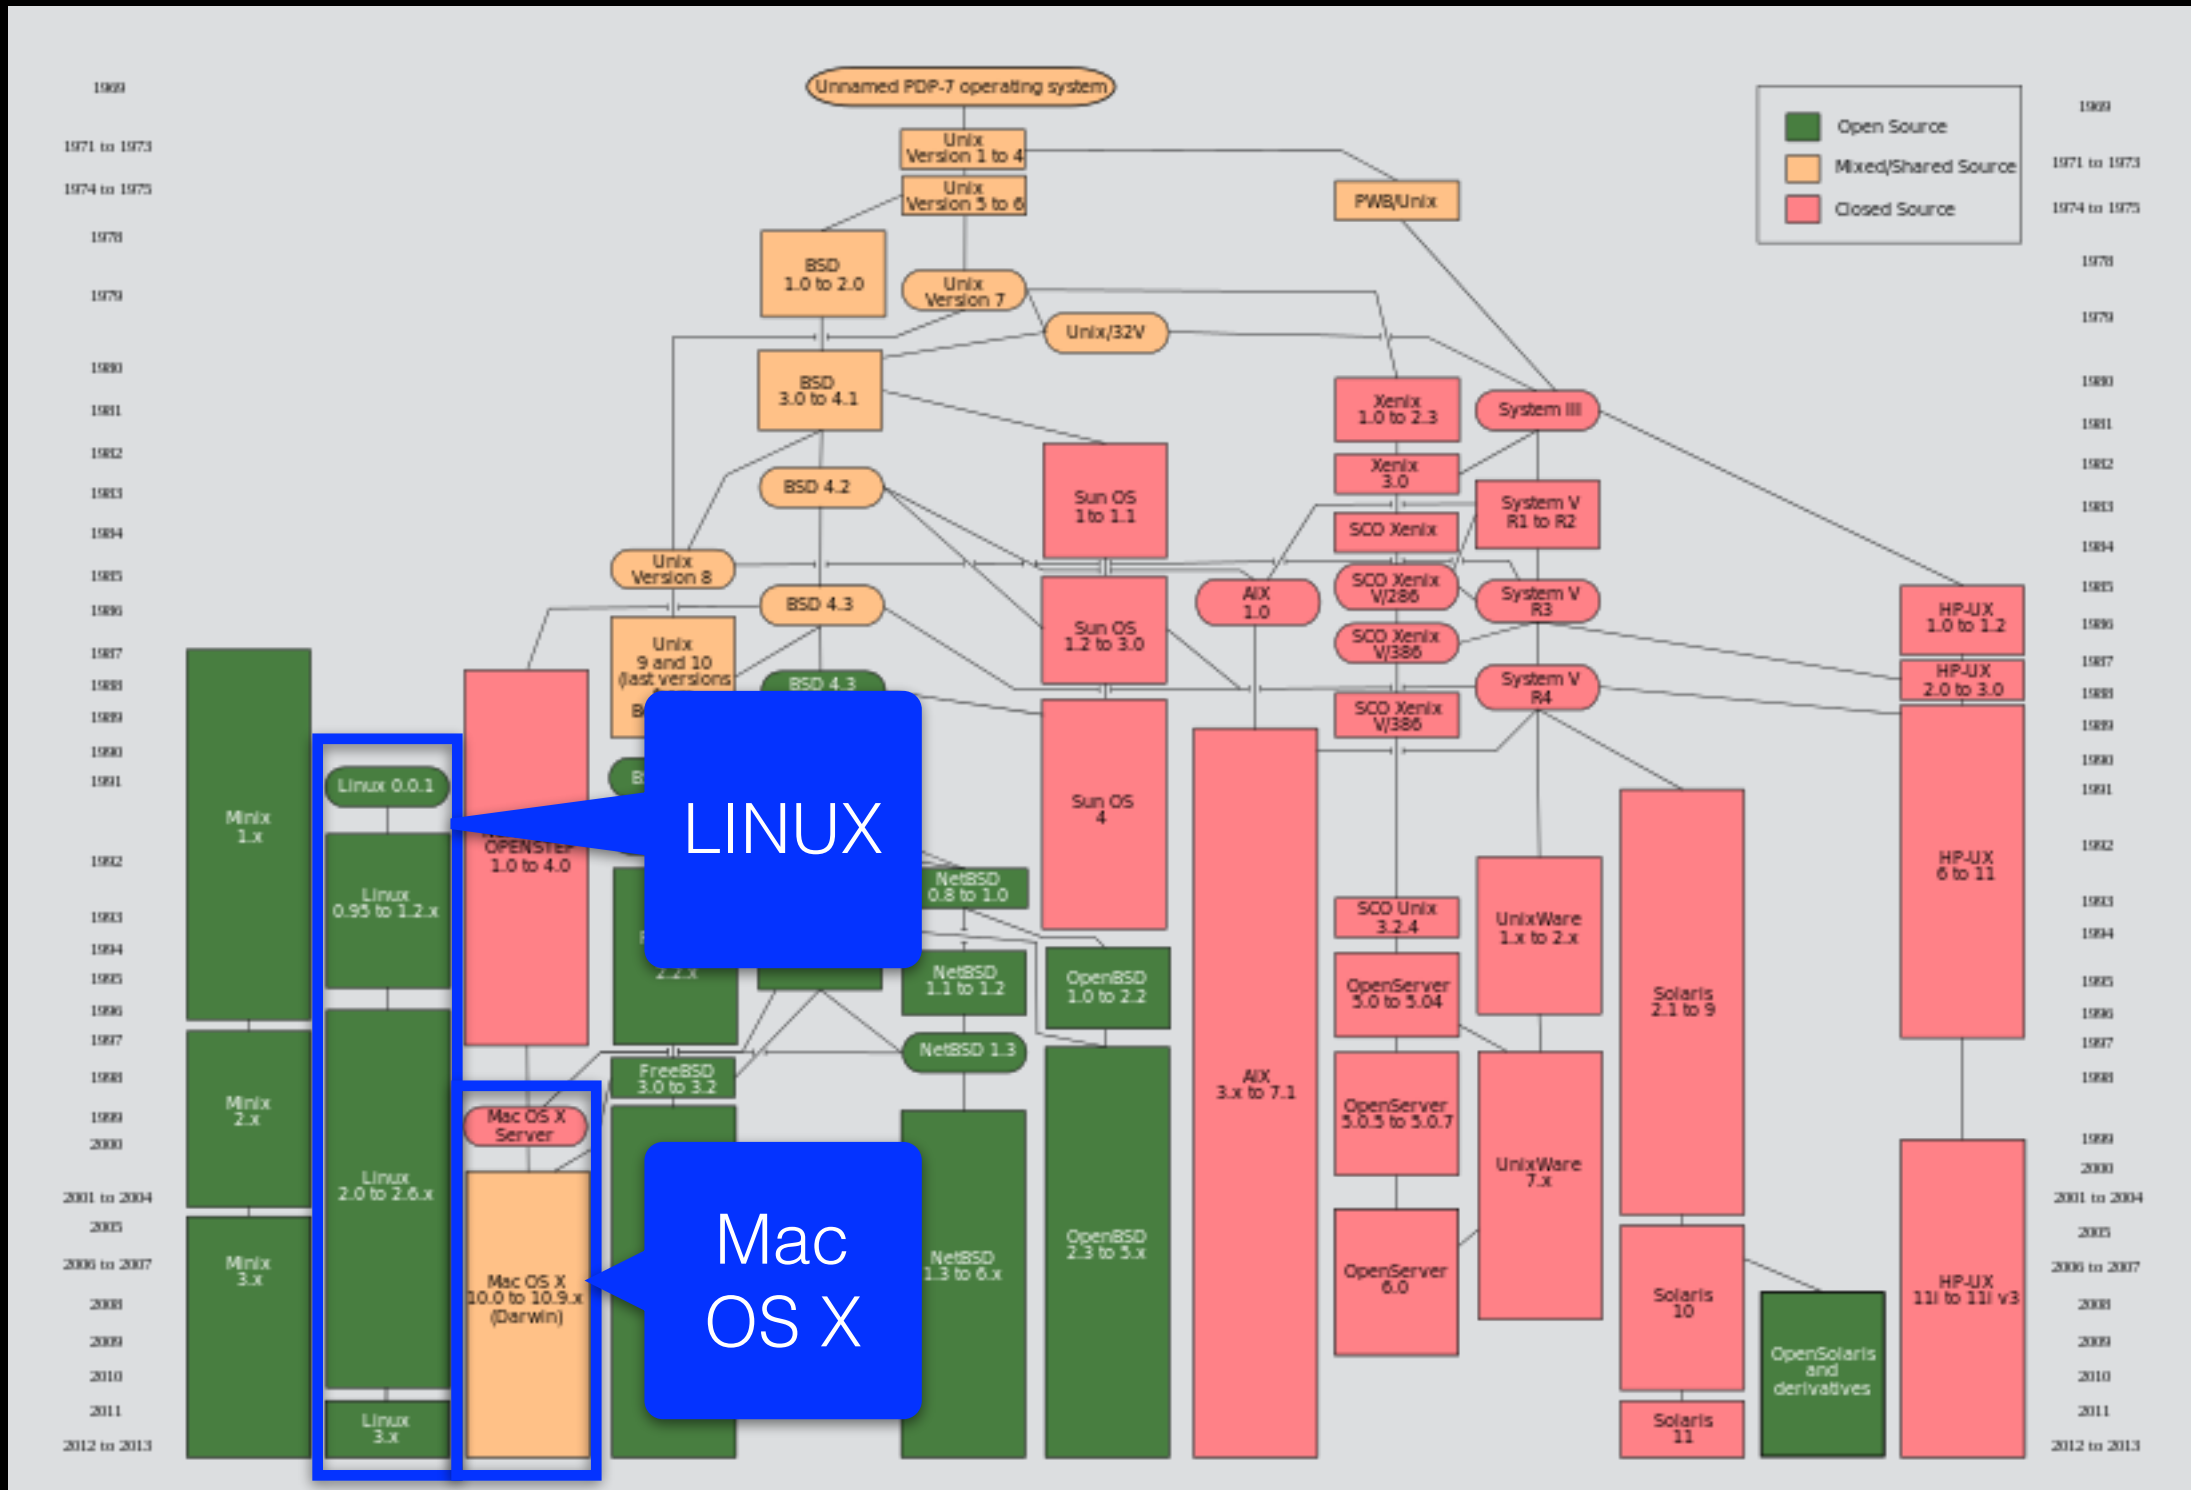

Unix ‘Philosophy’

“Write programs that do one thing and do it well. Write programs to work together and that encourage open standards. Write programs to handle text streams, because that is a universal interface.”

— Doug McIlory

Unix family tree [1969-2010]

Test: Connecting to remote machines (with **ssh**)

- Most high-performance computing (HPC) resources can only be accessed by **ssh** (Secure SHell)
 - > ssh [user@host.address]
 - > ssh barry@scs.gpcc.itd.umich.edu
 - > ssh -X barry@flux-login.arc-ts.umich.edu

Test: Your software versions

- We will use the **which** command to locate your versions of the major software we will be using this week.

```
> which R  
> R --version
```

Now do the same for **python** and **git** , *i.e.*

```
> which git  
> git --version
```

- If you get an 'error' or 'not found' msg let us know!
